COSMEDENT®

Dear Doctor,

I have never commented on bulk filled restoratives before this because I always felt that this class of materials had many shortcomings. However, I truly understand the need for something to replace the speed of amalgam placement.

That is why I am very excited to introduce you to Cosmedent's **new Renamel® BULKfill**, the **"Amalgam of Composite"**! This innovative composite combines the speed of amalgam placement with the impressive physical and esthetic properties of composite. It is both packable and sculptable, as well as immediately polishable and esthetic.

Renamel BULKfill cures to a depth of 4mm in 20 seconds with LED lights, 40 seconds with Halogen lights. If the restoration is deeper, it can be placed in layers to simulate dentin and enamel placement. It also has a high degree of radiopacity and can easily be differentiated with an x-ray.

Compared to other bulkfills, we have increased the opacity to enhance the color match to tooth structure. Esthetically, we have five shades available (A1, A2, A3, A3.5, and B1). Three additional shades, (B-Zero, C3 and D2) that match the VITA® Classic Shade Guide are coming in the next few months.

Renamel BULKfill addresses the problems of previous bulkfill materials: It is packable, not flowable, it stays in place, and you can sculpt any anatomy you desire prior to curing, and it stays that way. **Renamel BULKfill's** increased opacity overcomes the mismatch of hyper-transparency. Plus, this material makes rapid polishing possible.

All these factors make **Renamel BULKfill** the **"Amalgam of Composite"**! I hope you enjoy using **Renamel BULKfill** as much as I enjoyed helping produce it.

Happy bonding,

Bud Mopper
